

ABSTRACT

A sensor storage container is provided that allows sensors to be checked visually from the outside. A container 1 is used for storing sensors
5 14 including an oxidation-reduction enzyme that oxidizes or reduces an object to be analyzed, a mediator that mediates the transfer of electrons caused by oxidation or reduction, and a detection means that detects the oxidation or reduction reaction. The container 1 is transparent or semi-transparent in whole or in part and thereby the sensors can be checked visually from the
10 outside of the container. This container 1 may be composed of a container body 11 and a lid 12. The container body 11 may be provided with a scale 13. Preferably, the sensors are those produced using a ruthenium metal complex as the mediator.
